HW Submission Guidelines

March 19, 2020

General Instructions

1. Write your answers in a **single PDF** file (not a doc).
2. Theory and programming assignments should be on different pages. **Indicate at the top your names, ID numbers and e-mails** - same PDF.
3. Do not submit images, include them in the PDF.
4. In the PDF write some explanations for **every question** (even if it's just python file name).
5. Attach also python files
6. Put the PDF and all python files in a **single ZIP** file and send it with the students details (no additional comments in the mail). Name the zip with the students IDs, i.e. 123456789_234567890.zip.
7. Assignments should include answers to theory questions, a report containing plots and statistics as asked for and the code.
8. You are required to run 'validate.py' script (instructions inside) before you submit.
9. Exercises should be submitted through moodle.
10. Assignments can be done in groups of up to three students.

Theoretical Assignments

1. Follow the exercise specifications exactly. Seek clarifications if needed.
2. Your proofs should be both rigorous and clear.

Programming Assignments

1. Make sure your names, ID numbers and e-mails are printed on the report. If the grader encounters a technical problem and has no way to contact you, it will result in a significant point reduction.
2. Follow the exercise specifications exactly.
3. Your code should run properly on Python 3.6.
4. The directory should contain a README file that has the students names and following detailed:
 - (a) A description of each relevant source/input file.
 - (b) A command to execute and its parameters if any. This command should also set any required environment. You can specify a different command per question or subquestion, as long as it is clear, and there are no dependencies between the commands (i.e., command #2 does not assume command #1 was run). If you need such a dependency - make one command for two questions, etc.
 - (c) A description of each relevant output file.
5. Your program should not output warnings or errors when run correctly.
6. Make sure your program remains viable if your submitted files are moved (for example, don't refer to files you do not submit, and paths that are not necessarily accessible to others). In particular, watch for OS-dependent names (e.g., Windows-type path names).
7. Your code should be well documented and clear. Use meaningful variable names and sufficient comments to achieve this.
8. Your plots should be clear. Set meaningful labels and ranges on the axes, as well as meaningful titles and legends.
9. It is recommended that you use numpy vector and matrix operations instead of for loops with many iterations, whenever possible. This makes for faster, more compact programs.
